

DocuTracker - Document Digitization Process Guide

1. Overview

DocuTracker manages the end-to-end digitization of physical documents into structured digital records. Each document passes through a workflow: Batch Creation → Scanning → Scanning QC → Indexing → Indexing QC → Assembly.

2. Batch Creation

Purpose: Group physical documents into a structured unit (batch). Responsibilities: Create batch, assign Batch ID, define batch type, assign scanning queue. Output: Registered batch ready for scanning.

3. Scanning

Purpose: Convert physical documents into digital images. Responsibilities: Scan all pages, ensure correct order, maintain quality standards. Output: Digitized image set per batch.

4. Scanning QC

Purpose: Verify scanned images meet quality standards. Responsibilities: Check clarity, ensure all pages exist, validate order. Output: Approved or rejected batch.

5. Indexing

Purpose: Convert scanned images into structured data. Responsibilities: Extract metadata, classify documents, enter indexing data. Output: Structured digital records.

6. Indexing QC

Purpose: Validate indexed data accuracy. Responsibilities: Verify extracted fields, check correctness, approve/reject records.

7. Assembly

Purpose: Combine processed documents into final packages. Responsibilities: Group documents, validate completeness, finalize batch. Output: Completed digital batch.

8. Error Handling

If a document fails validation, it is sent back to the previous stage. All errors must be logged before completion.
